

(A) Backbone: Shows the overall organization of the polypeptide chain; a clean way to compare structures of related proteins.

(B) Ribbon: Easy way to visualize secondary structures, such as α helices and β sheets.

(Courtesy of David Lawson.)

(C) **Wire:** Highlights side chains and their relative proximities; useful for predicting which amino acids might be involved in a protein's activity, particularly if the protein is an enzyme.

(D) **Space-filling:** Provides contour map of the protein; gives a feel for the shape of the protein and shows which amino acid side chains are exposed on its surface. Shows how the protein might look to a small molecule, such as water, or to another protein.
